

iStar 2.0 — Strategic Dependency (SD) Model

Pistar source: SD-model.txt · **Tool:** Pistar 2.1.0 (Dalpiaz, Franch and Horkoff, 2016)

Reading the model

Nine actors. **ProBuild** is modelled as the **orchestrator hub**: it depends on four *internal capability agents* (Sales, Warehouse, Loyalty, Tool Hire) and on two *external partner agents* (FinTrust UK, FixPro Ltd), while the **Customer** depends on ProBuild for the outcomes it cares about. The two external partners are reachable only through dependencies that become **correlated messages** at runtime — never internal calls — reflecting the real organisational boundary.

Dependency (dependum)	Kind	Depender → Depende
Smooth purchasing experience	Quality (softgoal)	Customer → ProBuild
Goods delivered / Trade Card issued / Tool hired	Goal	Customer → ProBuild
Accurate priced quote	Task	ProBuild → Sales
Real-time stock truth	Resource	ProBuild → Sales
Order fulfilled / Return assessed	Goal / Task	ProBuild → Warehouse

Dependency (dependum)	Kind	Depender → Depende
Points & band maintained	Task	ProBuild → Loyalty
Tool booked at fair price	Goal	ProBuild → Tool Hire
Finance decision / Funds transferred	Goal / Resource	ProBuild → FinTrust UK
Tools serviced & compliant / Service report	Goal / Resource	ProBuild → FixPro Ltd
Stock replenished / Spare parts supplied	Resource	Sales, Tool Hire → Supplier

Every dependency maps directly onto the operational platform: a call-activity contract for the internal capabilities, a correlated message for the external partners (see [docs/istar-model.md](#) §4 for the full traceability table).
